Dynamical evolution Modelling challenges Analysis of the order

Model each process

Analyse different methods and gather the needed data.

Wide range of methods :

- Probabilistic methods based on rates:
- Discrete choice modelling;
- Heuristics models (Genetic Algorithms, ...); •
- ...

< 67 ▶

Order of these processes

Importance of the order

Classification

Classify the generations to analyse the orders that are grouped in a class.

Input to the classification :

- Number of women after 10 years;
- Number of men after 10 years;

Importance of the order

Classification

Classify the generations to analyse the orders that are grouped in a class.

Input to the classification :

- Number of women after 10 years;
- Number of men after 10 years;
- Number of less than 30 years old after 10 years;
- Number of 31-60 years old after 10 years;
- Number of more than 61 years old after 10 years.

Future work

- Try to avoid to choose the place of death and age by:
 - Add a birthday to each individual and adapt each probability to the fact that a part of the year he had one year less than the other part (linear combination of the probabilities ponderated by the number of days in each age)
 - Add a death day to determine if, for example, the mother die before giving birth to her baby.
