CHAPTER VI

SECURITY AND INCIDENT REPORTING REQUIREMENTS

Franck Dumortier

A. INTRODUCTION

Introduction In the current context of Big Data, cloud computing, Internet of 6-001 Things (IoT) and more generally the upward interconnection of IT systems. information security has moved from the sole technical field to become a key legal issue, not only to ensure the effectiveness of the fundamental rights to privacy1 and the protection of personal data² but also to improve the functioning of the internal market by creating trust and confidence. Both the General Data Protection Regulation³ ("GDPR") and the Directive on security of network and information systems⁴ ("NIS Directive") impose risk-based security measures and incident reporting obligations to warrant confidentiality, integrity and availability⁵ of information but their objectives are different: whereas the GDPR aims to safeguard the processing of personal data, the NIS Directive is focused on the resilience of networks and IT systems which play a vital role in society. Consequently, under the GDPR, security and incident reporting requirements depend on the risk for the rights and freedoms of natural persons whereas, under the NIS Directive, these obligations depend on the risk for the continuity of services which are considered to be essential to economic and societal activities. Given the broad definition of personal data,6 the organisations which must respect the provisions of the NIS Directive often also have to comply with the GDPR requirements.⁷ In parallel to these two pieces of legisla-

In *1 v Finland* (Application no.20511/03), [2008] CE:ECHR:2008:0717JUD002051103, the European Court of Human Rights decided that art.8, §1 of the European Convention of Human Rights implies practical and effective protection to exclude any possibility of unauthorised access to personal data.

² For aspects relating to privacy and data protection, see Chapter V.

³ Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC [2016] OJ L119/1 ("GDPR").

⁴ Directive (EU) 2016/1148 of the European Parliament and of the Council of 6 July 2016 concerning measures for a high common level of security of network and information systems across the Union [2016] OJ L194/1 ("Directive on security of network and information systems").

⁵ The ISO/IEC 27000 family—which is the most known and widely employed standard in the area of information security—is based on the CIA triad (confidentiality, integrity, availability).

⁶ Recital 30 of the GDPR specifies that even online identifiers can be considered personal data, which would seem to include in some instances IP addresses. In *Patrick Breyer v Bundesrepublik Deutschland* (C-582/14) EU:C:2016:930, the Court decided that dynamic IP addresses can constitute personal data. See also Article 29 Data Protection Working Party, Opinion 4/2007 on the concept of personal data, WP136 (20 June 2007). The concept of personal data is further discussed in para.5-011.

Directive on security of network and information systems art. 2.

tion, telecom providers are subject to a specific regime⁸ and the NIS Directive does not apply to undertakings targeted by EU sector-specific legislation imposing security and notification requirements, such as the eIDAS Regulation⁹ and the revised Payment Service Directive.¹⁰ Additionally, the Cybersecurity Act¹¹ provides for a new certification framework for ICT processes, products and services, together with a stronger role for the EU Cybersecurity Agency ("ENISA").

6-002 General Data Protection Regulation The GDPR, which replaces the 20-year old Data Protection Directive 95/46/EC,¹² is directly applicable in all Member Statea from 25 May 2018.¹³ Where a processing of personal data falls within the territor rial scope of the GDPR,¹⁴ one of the core obligations of both data controllers and data processors¹⁵ is to set up appropriate technical and organisational measures to ensure a level of security appropriate to the risk "to the rights and freedoms of natural persons".¹⁶ When such a risk is susceptible to being high, the data controller is accountable to conduct a data protection impact assessment before starting the processing.¹⁷ Furthermore, the Regulation lays down a set of rules on personal data breaches by introducing an obligation to notify the supervisory authority at the lat est within 72 hours from when the data breach is likely to pose a risk to an individual's rights and freedoms.¹⁸ In addition, when the personal data breach is likely to result in such a high risk, there is an obligation to inform the person whose data is concerned by the breach.¹⁹

6-003 Directive on security of network and information systems The NIS Directive which entered into force in August 2016 is the first EU horizontal legislation addressing cybersecurity challenges in Europe. Member States had to transpose the

INTRODUCTION

manifements of the Directive into their own national laws by 9 May 2018.20 The and of the NIS Directive is to boost the overall level of cybersecurity in the EU by requiring Member States to adopt a national strategy on the security of network and aformation systems, creating a Cooperation Group in order to support and facilitate mategic cooperation, and requiring Member States to designate national competent authorities, single points of contact and Computer Security Incident Response Teams (CSIRTs).²¹ Moreover, the Directive establishes security and notification requirements for operators of essential services ("OESs") and digital service provid-"DSPs"). Although the Directive defines the types of DSPs falling in its scope renline marketplaces, online search engines and cloud computing services²² when these types of services are not offered by micro- and small enterprises²³), each Member State is responsible for identifying the OESs established in their territories. The following must be identified as an OES: (i) any public or private entity which movides a service which is essential for the maintenance of critical societal and/or economic activities in the sectors²⁴ of energy (e.g., electricity, oil and gas companies), transportation (including air, rail, water and road transport), healthcare the hospitals and private clinics), certain banking and finance institutions (such as credit), suppliers and distributors of drinking water, and digital infrastructure (internet exchange points, domain name service providers and top level domain name registries); (ii) which depends on network and information systems; and (iii) on which an incident would have significant disruptive effects.²⁵ Both the OESs and the DSPs must take appropriate and proportionate technical and organisational measures to manage risks and prevent incidents affecting the security of their network and information systems and notify competent national authorities of security incidents of particular magnitudes, calculated in terms such as the number of users affected, the duration of the incident or the geographical spread with regard to the area affected by the incident.²⁶

Cybersecurity Act The Regulation containing the Cybersecurity Act focuses on two key elements. Firstly, it replaces the previous ENISA Regulation²⁷ with the aim to create a permanent mandate²⁸ for the EU cybersecurity agency. The objective is to increase the agency's financial and human resources in order to ensure that ENISA cannot only provide expert advice, as has been the case until now, but can also perform operational tasks, notably to ensure effective and coordinated responses at Union level in the case of large-scale cross border incidents. Secondly, the Regulation provides for a voluntary European cybersecurity certification framework to encourage ICT products, services and processes being sold in EU countries to comply with cybersecurity standards. Indeed, while an increasing

6-004

⁹ Regulation (EU) no.910/2014 of the European Parliament and of the Council of 23 July 2014 on electronic identification and trust services for electronic transactions in the internal market and repealing Directive 1999/93/EC [2014] OJ L275/73 ("eIDAS Regulation").

¹⁰ Directive (EU) 2015/2366 of the European Parliament and of the Council of 25 November 2015 on payment services in the internal market, amending Directives 2002/65/EC, 2009/110/EC and 2013/ 36/EU and Regulation (EU) No.1093/2010, and repealing Directive 2007/64/EC [2015] OJ L337/35 ("Revised Payment Service Directive").

¹¹ Regulation (EU) 2019/881 of the European Parliament and of the Council of 17 April 2019 on ENISA (the European Union Agency for Cybersecurity) and on information and communications technology cybersecurity certification and repealing Regulation (EU) no.526/2013 ("Cybersecurity Act").

¹² Directive 95/46/EC of the European Parliament and of the Council of 24 October 1995 on the protection of individuals with regard to the processing of personal data and on the free movement of such data [1995] OJ L281/38 ("Directive 95/46/EC").

¹³ GDPR is discussed in paras 5-004, 5-009 and onwards.

¹⁴ "GDPR art.3" defines the territorial scope of the Regulation on the basis of two main criteria: the "establishment" criterion, as per art.3(1), and the "targeting" criterion as per art.3(2). Where one of these two criteria is met, the relevant provisions of the GDPR will apply to the processing of personal data by the controller or processor concerned. In addition, art.3(3) confirms the application of the GDPR to the processing where Member State law applies by virtue of public international law. About the territorial scope, see European Data Protection Board, "Guidelines 3/2018 on the territorial scope of the GDPR (Article 3)", draft for public consultation (16 November 2018). See also para.5-010

 ¹⁵ These concepts have been analysed in Article 29 Data Protection Working Party, Opinion 1/2010 on the concept of "controller" and "processor", WP169 (16 February 2010). See also para 5-012.

²² The types of DSPs are listed in Annex III of the Directive on security of network and information systems.

³ Directive on security of network and information systems art.16.11.

Each sector and subsector covered is listed in Annex II of the Directive on security of network and information systems.

Directive on security of network and information systems art.5.2.

Directive on security of network and information systems arts 14 to 16.

⁷⁷ Regulation (EU) No.526/2013 of the European Parliament and of the Council of 21 May 2013 concerning the European Union Agency for Network and Information Security (ENISA) and repealing Regulation (EC) No.460/2004 [2013] OJ L165/41.

The agency was established for a period of seven years beginning on 19 June 2013 and its mandate would therefore have ended in June 2020.

number of devices is connected to the internet, security and resilience are not alua sufficiently built in by design. The Digital Single Market, and in particular the a economy and the IoT, can thrive only if there is general public trust that such products, services and processes provide a certain level of cybersecurity. Therefore the Cybersecurity Act contains rules governing European cybersecurity certified tion schemes allowing certificates issued under those schemes to be valid and recognised across all Member States and addressing the current marker fragmentation.

B. SECURITY OF PERSONAL DATA (GDPR)

1. Principles and allocation of responsibilities

The principle of integrity and confidentiality The GDPR establishes is 6-005principle of "integrity and confidentiality" of personal data at the same level as the traditional data quality principles (lawfulness, fairness and transparency; purpose limitation; data minimisation; accuracy; storage limitation).²⁹ According to the principle, personal data must be processed in a manner that ensures appropriate security, including protection against unauthorised or unlawful processing, and against accidental loss, destruction or damage, using appropriate technical a organisational measures.³⁰ Unlike the properties of integrity and confidentiality, the property of availability is not expressly mentioned in art.5.1(f). Nonetheless the Article 29 Working Party-which is now replaced by the European Data Protection tion Board ("EDPB")³¹---considers that personal data breaches can be categorised according to the three information security properties as follows: (1) "confidentiality breach", where there is an unauthorised or accidental disclosure of, or access to personal data; (2) "integrity breach" where there is an unauthorised or accidental alteration of personal data; and (3) "availability breach" where there is an ac cidental or unauthorised loss of access to, or destruction of, personal data,32 This leads ENISA to consider that, under the GDPR, the security principle equally covers confidentiality, integrity and availability.33

6-006

Admention of roles, security and accountability For both the data controller³⁴ and the data processor,³⁵ one of the core obligations under the GDPR is that of the security of personal data. Accordingly, the two actors³⁶ are required to have in place ecopriate technical and organisational measures to ensure a level of security apepriate to the risk "to the rights and freedoms of natural persons" posed to the asonal data being processed³⁷ and provide a general description of these measures. where possible, in their records of processing activities.³⁸ In comparison with the that processor, the data controller has an additional duty of accountability according to which they are obliged to implement appropriate and effective measures, and able to demonstrate compliance with the Regulation of processing activities carred out by the controller or on the controller's behalf, including the effectiveness the measures.³⁹ This accountability requirement includes two elements: the need for data controllers to implement real and effective policies, procedures and mechanisms to safeguard the protection of individuals' information, as well as the Autoation to maintain evidence in order to prove this should data protection authorimes request it.⁴⁰ In practice, this additional accountability obligation consists in carraing out a data protection impact assessment ("DPIA"), to identify where a type at processing is "likely to result in a high risk to the rights and freedoms of natural ersons".⁴¹ Clarifying the roles also has an impact on the confidentiality rule enshrined in art.29 of the GDPR according to which the processor and any person acting under the authority of the controller or of the processor, who has access to ursonal data, shall not process that data except on instructions from the controler unless required to do so by Union or Member State law.

toint-controllership Where a controller determines the purposes and means of 6-007 the processing jointly with other controllers, the liability of the joint controllers monires a clear and transparent allocation of their responsibilities by means of an arrangement between them unless, and in so far as, the respective responsibilities of the controllers are determined by Union or Member State law to which the controllers are subject.⁴² In addition to a precise definition of their respective obligations, the arrangement must duly reflect the respective roles and relationships of the ioint controllers vis-à-vis the data subjects and may designate a contact point for them. However, irrespective of the terms of the arrangement, the data subject may exercise his or her rights in respect of and against each of the controllers.⁴³ In cases in which their processing requires a DPIA, the arrangement should set out which party is responsible for the various measures designed to treat risks and to protect

- The concepts of controller and processor are discussed in para.5-012. GDPR art. 32.1.
- GDPR arts 30.1(g) and 30.2(d). GDPR arts 5.1(f), 24 and recital 74.

²⁹ Under Directive 95/46/EC, the security principle was not listed amongst the principles relating to data quality. However, its art.17 already imposed the security duty to both the data controller and the data processor.

³⁰ GDPR art.5.1(f). See also Chapter V (para.5-020).

This Working Party was set up under art.29 of the Directive 1995/46/EC as an EU advising body 31 with specific tasks. The Party consisted of a representative of the national data protection authority ties, of the EU Commission and of the European Data Protection Supervisor. This Working Party is transformed under the GDPR into the European Data Protection Board ("EDPB"). See also parade 038.

³² Article 29 Working Party, Guidelines on Personal data breach notification under Regulation 2010 679, WP250rev.01 (6 February 2018), p.7.

³³ ENISA, Guidelines for SMEs on the security of personal data processing (December 2016), p.7.

The "controller" is defined in art.4(7) of the GDPR as being "the natural or legal person, public authority, agency or other body which, alone or jointly with others, determines the purposes and means of the processing of personal data; where the purposes and means of such processing are determined by Union or Member State law, the controller or the specific criteria for its nomination may be provided for by Union or Member State law".

The "processor" is defined in art.4(8) of the GDPR as being "a natural or legal person, public authority, agency or other body which processes personal data on behalf of the controller".

Article 29 Working Party, Opinion 3/2010 on the principle of accountability, WP 173 (13 July 2010), p.5.

GDPR art.35.1.

GDPR art.26,1 and recital 79.

GDPR arts 26.1 and 26.2.

the rights and freedoms of the data subjects. Each data controller should express their needs and share useful information without either compromising secrets (e.g. protection of trade secrets, intellectual property, confidential business information) or disclosing vulnerabilities.⁴⁴ Furthermore, the EDPB recommends that the contractual arrangements between joint controllers include provisions that determine which controller will take the lead on, or be responsible for, compliance with the GDPR's breach notification obligations.⁴⁵

Processing on behalf of a controller Where processing is to be carried out an 6-008 behalf of a controller, the controller shall use only processors providing sufficient guarantees in particular in terms of expert knowledge, reliability and resources in implement technical and organisational measures, including for the security of ma processing.⁴⁶ In order to warrant appropriate safeguards, processing by a process sor must be governed by a contract or other legal act under Union or Member State law, that is binding on the processor with regard to the controller and that sets on the subject matter and duration of the processing, the nature and purpose of the processing, the type of personal data and categories of data subjects, and the obligation tions and rights of the controller.47 The contract must also contain minimum terms requiring, amongst others, the processor to only act on the written instructions of the controller; ensure that persons authorised to process personal data are sublear to a duty of confidence; take appropriate measures to ensure the security of process ing; assist the controller in meeting its own obligations in relation to the security of processing, the notification of personal data breaches and data protection impact assessments; submit to audits and inspections and provide the controller with whatever information it needs to ensure that they are both meeting their contractual obligations.⁴⁸ Furthermore, where a processor wants to engage a sub-processor for carrying out specific processing activities on behalf of the controller, this may not be done without prior specific or general written authorisation of the controller⁴⁹ and the same data security obligations as set out in the contract between the controller and the processor must be contractually imposed on that sub-processor,⁵⁰ In case the sub-processor fails to fulfil its data protection obligations, the initial processor remains fully liable to the controller for the performance of that other processor's obligations.

6-009 Allocation of roles and liability Any person who has suffered material or nonmaterial damage as a result of a security breach has the right to receive compensation either from the (joint) controller or processor for the damage suffered.⁵¹ In order to ensure effective compensation of the data subject, the GDPR institutes a cumula

ave liability regime in the sense that where controllers and processors are involved a the same processing and are responsible for any damage caused by a security nreach, each shall be held liable for the entire damage.⁵² However, a processor or controller that is held liable to pay compensation on this basis is entitled to recover nom other relevant parties that part of the compensation corresponding to their part of the responsibility for the damage,⁵³ In this perspective, the allocation of roles hetween the data controller and the data processor has consequences on the liability exposure of the different actors involved in personal data processing merations.³⁴ Whereas any controller remains generally liable for any damages arising from the unlawful processing, the processor is only liable if they fail to comply with the obligations of the GDPR directed specifically to processors or if they acted outside or contrary to lawful instructions of the controller.55 In case of a data breach, hoth actors can only be exempted from their liability if they prove they are not in any way responsible for the event giving rise to the damage. 56 Such evidence is not always easy to provide given that the duty of security enshrined in art.32 must be considered as an obligation of means-and not of result-according to which data controllers and data processors should act with the necessary degree of care and diligence to achieve an appropriate level of security. As a consequence of this categorisation, a debtor can only effectively avoid liability by demonstrating that they have selected and implemented every reasonable measure that might be expected from him to fulfil their obligation. Moreover detailed contractual clauses can bound a data processor or a (joint) controller by obligations of result, for example by imposing specific cryptographic algorithms, physical and logical access controls, or logging of processing operations. In such circumstances, one party can engage the liability of the other party more easily by merely demonstrating that the contractual result has not been achieved.

2. Evaluation of risks and appropriate security measures

Evaluation of risks A distinction must be made between "inherent" risk and "residual" risk. Inherent risk refers to the probability that a negative impact will occur when no protective action is taken. Residual risk refers to the probability that a negative impact will occur despite the measures taken to influence (or limit) the inherent risk.⁵⁷ Unlike risk management in information security—which is oriented towards the "assets"⁵⁸ of the organisation—the GDPR aims to manage risks "to the rights and freedoms of natural persons" which could lead to physical, material or

An information asset is a piece of data which has value to the organisation (e.g. an employee record, analysis reports, financial data of the organisation, etc.). See European Data Protection Supervisor, *Security Measures for Personal—Data Processing Article 22 of Regulation 45/2001* (21 March 2016), p.5.

SECURITY OF PERSONAL DATA (GDPR)

SECURITY AND INCIDENT REPORTING REQUIREMENTS

non-material damages.⁵⁹ As indicated by the Article 29 Working Party, the resta ence to "the rights and freedoms" of data subjects primarily concerns the rights data protection and privacy but may also involve other fundamental rights such freedom of speech, freedom of thought, freedom of movement, prohibition of discrimination, right to liberty, conscience and religion.60 Recital 75 of the GDpa provides for a non-exhaustive list of examples of potential negative impacts on data subject's rights: discrimination, identity theft or fraud, financial loss, damage to financial l reputation, loss of confidentiality of personal data protected by professional secrece unauthorised reversal of pseudonymisation,⁶¹ situations where data subjects might be deprived of their rights and freedoms or prevented from exercising control over their personal data, or any other significant economic or social disadvantage. Article 32.2 of the GDPR identifies the threats which could lead to such risks. These threats consist, in particular, in accidental or unlawful destruction, loss, alteration unauthorised disclosure of, or access to personal data transmitted, stored m otherwise processed.⁶² As already mentioned, in addition to illegitimate access the data (loss of confidentiality), to unwanted modification of data (loss of integring and definitive unavailability of data, the Article 29 Working party also consider temporary unavailability of the processing, whether accidental (e.g. due to a power outage) or illicit (for example, following a "denial of service" attack)63 as being an additional threat which could result in risks for data subjects' rights. The identified risks must be estimated in terms of severity and likelihood⁶⁴ which should be determined by reference to the nature, scope, context and purposes of the processing.65 According to the French supervisory authority, severity represents the magnitude of a risk and primarily depends on the prejudicial nature of the potential impact; likelihood expresses the possibility of a risk occurring which depends on the level of vulnerabilities of the supporting assets when under threat and the level of capabilities of the risk sources to exploit them.⁶⁶ ENISA has issued guidelines for SMEs to assess security risks for personal data using an approach which is based on four steps, as follows: definition of the processing operation and its context,

[340]

understanding and evaluation of impact, definition of possible threats and evaluation of their likelihood (threat occurrence probability) and evaluation of risk combining threat occurrence probability and impact).⁶⁷

6-011

selection of appropriate security measures The selection of appropriate security measures follows the "risk-based approach"68 embodied by the GDPR acerrding to which the higher the inherent risk, the more rigorous the security measures that the controller or the processor needs to take in order to reach an accentable residual risk. After the evaluation of the inherent risk level and taking into account the state of the art⁶⁹ as well as the costs of implementation, the controller and the processor must implement technical and organisational measures to ensure a level of security appropriate to the risk.²⁰ The GDPR does not impose specific security measures but instead indicates that these may inter alia include, as appropriare the pseudonymisation and encryption of personal data; the ability to ensure the ongoing confidentiality, integrity, availability and resilience of processing systems and services; the ability to restore the availability and access to personal data in a nmely manner in the event of a physical or technical incident; and a process for regularly testing, assessing and evaluating the effectiveness of technical and organisational measures for ensuring the security of the processing. National supervisory authorities provide more concrete guidance to implement appropriate security measures.⁷¹ In addition, the controller and processor must take steps to ensure that any natural person acting under the authority of the controller or the processor who has access to personal data does not process them except on instrucnons from the controller, unless he or she is required to do so by Union or Member State law,⁷² Adherence to an approved code of conduct⁷³ or an approved certifica-

⁵⁹ GDPR recital 75.

⁶⁰ Article 29 Working Party, Statement on the role of a risk-based approach to data protection legal frameworks, WP218 (30 May 2014), p.4.

⁶¹ "Pseudonymisation" is defined in art.4(5) of the GDPR as "the processing of personal data in such a manner that the personal data can no.longer be attributed to a specific data subject without the use of additional information, provided that such additional information is kept separately and is subject to technical and organisational measures to ensure that the personal data are not attributed to an identified or identifiable natural person".

⁶² GDPR art.32.2.

⁶³ Distributed denial of service ("DDoS") attacks take advantage of the specific capacity limits that apply to any network resources—such as the infrastructure that enables a company's website. The DDoS attack will send multiple requests to the attacked web resource—with the aim of exceeding the website's capacity to handle multiple requests and prevent the website from functioning correctly.

⁶⁴ According to the French Supervisory Authority (CNIL), "a risk is a hypothetical scenario that describes a feared event and all the threats that would allow this to occur. More specifically, it describes: how risk sources (e.g.: an employee bribed by a competitor) could exploit the vulner-abilities of supporting assets (e.g.: the file management system that allows the manipulation of data) in a context of threats (e.g.: the file management system that allow feared events to occur (e.g.: Il legitimate access to personal data) on personal data (e.g.: customer file) thus generating impacts on the privacy of data subjects (e.g.: unwanted solicitations, feelings of invasion of privacy, personal or professional problems)". See CNIL, *Privacy Impact Assessment (PIA)—methodology* (February 2018), p.6.

⁶⁵ GDPR recital 76.

⁶⁶ CNIL, Privacy Impact Assessment (PIA)-methodology (February 2018), p.6.

ENISA, Guidelines for SMEs on the security of personal data processing (December 2016). The Agency continued its activities in the area and focused on providing further guidance on the application of the aforementioned guidelines through specific uses cases. See ENISA, *Handbook on security af personal data processing* (December 2017).

According to the Article 29 Working Party, "it is important to note that—even with the adoption of a risk-based approach—there is no question of the rights of individuals being weakened in respect of their personal data. Those rights must be just as strong even if the processing in question is relatively 'low risk'. Rather, the scalability of legal obligations based on risk addresses compliance mechanisms. This means that a data controller whose processing is relatively low risk may not have to do as much to comply with its legal obligations as a data controller whose processing is high-risk'. See Article 29 Working Party, Statement on the role of a risk-based approach to data protection legal frameworks, WP218 (30 May 2014), p.2.

TeleTrusT—IT Security Association Germany has written guidelines that are published in English in cooperation with ENISA about the meaning of "state of the art". TeleTrusT—IT Security Association Germany, IT Security Act (Germany) and EU General Data Protection regulation—Guideline "State of the art" (2019), available at https://www.teletrust.de/en/publikationen/broschueren/stateof-the-art-in-it-security [Accessed 16 September 2019].

As referred to in GDPR art.40,

tion mechanism⁷⁴ may be used as an element by which to demonstrate compliance with the security requirements.⁷⁵

3. Data protection impact assessment

6-012 Data protection impact assessment in case of a high risk In line with the risk based approach, where a type of processing is likely to result in a high risk to the rights and freedoms of natural persons, data controllers must carry out a DPIA of If the processing is wholly or partly performed by a data processor, the processor should assist the controller in carrying out the DPIA and provide any necessary information.⁷⁷ The GDPR provides three non-exhaustive examples of processing operations which are likely to result in an inherent high risk⁷⁸: (i) a systematic⁷⁹ and extensive evaluation of personal aspects relating to natural persons which is based on automated processing, including profiling,⁸⁰ and on which decisions are based that produce legal effects concerning the natural person or similarly significantly affect the natural person; (ii) processing on a large scale⁸¹ of special categories of data⁸² or of personal data relating to criminal convictions and offences;⁸³ or (iii) a systematic monitoring⁸⁴ of a publicly accessible area⁸⁵ on a large scale.

6-013 Lists of processing operations requiring a DPIA In order to provide a more

- ⁷⁴ As referred to in GDPR art.42.
- 75 GDPR art.32.3.
- ⁷⁶ GDPR art.35.1.
- ⁷⁷ GDPR art.28.3(f).
- 78 GDPR art.35.3.
- ⁷⁹ The Article 29 Working Party interprets "systematic" as "meaning one or more of the following; occurring according to a system; pre-arranged, organised or methodical; taking place as part of a general plan for data collection; carried out as part of a strategy". See Article 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017), p.10.
- According to art.4(4) of the GDPR, "profiling means any form of automated processing of personal data consisting of the use of personal data to evaluate certain personal aspects relating to a natural person, in particular to analyse or predict aspects concerning that natural person's performance at work, economic situation, health, personal preferences, interests, reliability, behaviour, location or movements".
- ⁸¹ The Article 29 Working Party recommends that the following factors, in particular, be considered when determining whether the processing is carried out on a large scale: "the number of data subjects concerned either as a specific number or as a proportion of the relevant population; the volume of data and/or the range of different data items being processed; the duration, or permanence, of the data processing activity; the geographical extent of the processing activity". See Article 29 Working Party, Guidelines on Data Protection Officers ('DPOs'), WP243 rev.01 (5 April 2017), p.9.
- ⁸² As referred to in art.9.1 of the GDPR.
- ⁸³ As referred to in art.10 of the GDPR.
- ⁸⁴ According to the Article 29 Working Party, "the concept of 'monitoring of the behaviour of data subjects' is mentioned in recital 24 and clearly includes all forms of tracking and profiling on the internet, including for the purposes of behavioural advertising. However, the notion of monitoring is not restricted to the online environment and online tracking should only be considered as one example of monitoring the behaviour of data subjects". See Article 29 Working Party, Guidelines on Data Protection Officers ("DPOs"), WP243 rev.01 (5 April 2017), p.8.
- ⁸⁵ The Article 29 Working Party interprets "publicly accessible area" as being "any place open to any member of the public, for example a piazza, a shopping centre, a street, a market place, a train station or a public library". See Article 29 Working Party, Guidelines on Data Protection Impact As sessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017), p.9.

superete set of processing operations which are likely to result in a high risk, the national supervisory authorities ("SAs") must establish and make public a list of the kind of processing operations which are subject to the requirement for a DPIA.⁸⁶ Pach national SA must communicate this draft list to the EDPB which is entitled n issue an opinion with the aim to apply the consistency mechanism as to avoid significant inconsistencies between EU Member States that may affect the equivalent protection of data subjects.⁸⁷ To support SAs in identifying when DPIAs are necessary, the Article 29 Working Party has issued Guidelines, endorsed by the EDPB, which set out a list of nine criteria to consider when identifying processing operations requiring a DPIA.⁸⁸ These criteria are met when processing involves evaluation or scoring including profiling and predicting; automated decisionmaking with legal or similar significant effect; systematic monitoring, sensitive data or data of a highly personal nature; data processed on a large scale; matching or combining datasets; data concerning vulnerable data subjects such as children, employees or the elderly; innovative use or applying new technological or organisational solutions; and preventing data subjects from exercising a right or using a service or contract. In most cases, a processing meeting two of those criteria would require a DPIA to be carried out, however, in some cases, a processing operaion meeting only one of these criteria may require a DPIA, depending on the circumstances.⁸⁹ In line with those obligations, the SAs of 26 Member States submitted draft lists to the EDPB identifying data processing activities likely to result in a high risk and which therefore require DPIAs. The EDPB issued opinions on each of these lists, requesting that some SAs include certain types of processing in their lists, remove other types that the Board did not consider as creating high risks for data subjects, and use some criteria in a harmonised manner.⁹⁰

Content, scope and methodology of a DPIA The GDPR does not formally define the concept of a DPIA as such, but specifies that it must contain at least a systematic description of the envisaged processing operations and the purposes of the processing; an assessment of the necessity and proportionality of the processing operations in relation to the purposes; an assessment of the risks to the rights and freedoms of data subjects; and the measures envisaged to address the risks, including safeguards, security measures and mechanisms to ensure the protection of personal data and to demonstrate compliance.⁹¹ In accordance with the data protection by design and by default principles,⁹² a DPIA should be carried out prior to the processing⁹³ and, as a matter of good practice, be continuously reviewed and

- Article 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017), p.11
- All of these opinions are on the website of the EDPB and available at https://edpb.europa.eu/ourvork-tools/consistency-findings/opinions_en [Accessed 16 September 2019].
- GDPR art.35.7.
- GDPR art.25,

GDPR art.35.4. Note that art.35.5 provides that SAs may also establish and make public a list of the kind of processing operations for which no DPIA is required. These lists must also be communicated to the EDPB.

GDPR art.64.

GDPR arts 35.1 and 35.10, recitals 90 and 93. However, the requirement to carry out a DPIA ap-

regularly re-assessed.⁹⁴ The controller is ultimately responsible for ensuring the DPIA is carried out, but the DPIA may be carried out by someone else, inside outside of the organisation.95 The controller must also seek the advice% of the t Protection Officer97 (DPO), where designated, and this advice, along with the a sions taken, should be documented within the DPIA.98 Where appropriate controller is required to seek the view of data subjects.⁹⁹ It must documentation iustification for not seeking the views of data subjects, if it decides that this action appropriate.¹⁰⁰ A DPIA may concern a single data processing operation but can also be used to assess multiple processing operations that are similar in terms nature, scope, context, purpose and risks. This may also be applicable to similar processing operations implemented by various data controllers. In those case reference DPIA should be shared or made publicly accessible, measures describe in the DPIA must be implemented, and a justification for conducting a single top. has to be provided. The Article 29 Working Party encourages the development sector-specific DPIA frameworks, so that the DPIA can address the issues that an in a particular economic sector, or when using particular technologies. The const provides controllers with flexibility to determine the precise structure and form a the DPIA. Annex 1 of the Article 29 Working Party's Guidelines usefully service examples of existing EU DPIA frameworks, in Germany, Spain, France and the re-Annex 2 further sets out criteria for an acceptable DPIA. Publishing a DPIA in the a legal requirement of the GDPR, and is at the controller's discretion. However, Article 29 Working Party encourages the publication of DPIAs, as such a process would help foster trust in the controller's processing operations, and demonstrate accountability and transparency.¹⁰¹

6-015 **Prior consultation of the supervisory authority** Where a DPIA reveals a high residual risk which cannot be mitigated by appropriate measures in terms of available.

plies to existing processing operations likely to result in a high risk to the rights and freedups of natural persons and for which there has been a change of the risks, taking into account the natural scope, context and purposes of the processing. See Article 29 Working Party, Guidelines on Pau Protection Impact Assessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017), p.13

⁹⁴ See Article 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017), p.14.

- ⁹⁵ See Article 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017).
- ⁹⁶ GDPR art.35.2.

⁹⁷ GDPR art.37 indicates cases in which it is mandatory for certain controllers and processer to designate a DPO. Moreover, even when the GDPR does not specifically require the appointment of a DPO, organisations may sometimes find it useful to designate one on a voluntary basis. See allo Article 29 Working Party, Guidelines on Data Protection Officers ("DPOs"), WP243 rev.01 (3 Apr 2017). See also para.5-027.

⁹⁹ GDPR art.35.9.

SECURITY OF PERSONAL DATA (GDPR)

the technology and costs of implementation, the data controller is required to seek pror consultation for the processing from the supervisory authority¹⁰² which may provide its advice.¹⁰³ An example of an unacceptable high residual risk includes instances where, despite the envisaged security measures, the data subjects may encounter significant, or even irreversible, consequences, which they may not overcome (e.g. an illegitimate access to data leading to a threat on the life of the data subjects, a layoff, a financial jeopardy) and/or when it seems obvious that the obst will occur (e.g. by not being able to reduce the number of people accessing the data because of its sharing, use or distribution modes, or when a well-known vulneranility is not patched).¹⁰⁴ As part of this prior consultation, the DPIA must be fully provided.¹⁰⁵

4. Notification and communication of security breaches

6-016

Matification of personal data breaches The GDPR requires the controller to nulfy any personal data breach to the supervisory authority unless the breach is inlikely to result in a risk to the rights and freedoms of natural persons. An example of this exemption might be where personal data is already publically available and a disclosure of such data does not constitute a likely risk to the individual.¹⁰⁶ The article 29 Working Party considers that a controller should be regarded as having become "aware" when they have a reasonable degree of certainty that a security indicent has occurred that has led to personal data being compromised.¹⁰⁷ Once the controller has become aware, a notifiable breach must be notified without undue delay, and where feasible, not later than 72 hours. During this period, the controlber should assess the likely risk to individuals in order to determine whether the requirement for notification has been triggered, as well as the action(s) needed to address the breach.¹⁰⁸ The notification must, at least, describe the nature of the personal data breach including where possible, the categories and approximate

Arnete 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017), p.19.

Ancele 29 Working Party, Guidelines on Personal data breach notification under Regulation 2016/ 679, WP250 rev.01 (6 February 2018), pp.18-19. According to the Article 29 Working Party, this would similarly be the case if personal data, such as passwords, were securely hashed and salted, the bashed value was calculated with a state of the art cryptographic keyed hash function, the key used to hash the data was not compromised in any breach, and the key used to hash the data has been generated in a way that it cannot be ascertained by available technological means by any person who is not authorised to access it.

See Article 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017), pp.10-11. According to the Article 29 Working Party, when, exactly, a controller can be considered to be 'aware' of a particular breach will depend on the circumstances of the specific breach. In some cases, it will be relatively clear from the outset that there has been a breach, whereas in others, it may take some time to establish if personal data have been compromised. However, the emphasis should be on prompt action to investigate an incident to determine whether personal data have indeed been breached, and if so, to take remedial action and notify if required".

the Article 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 406/679, WP248 rev.01 (4 October 2017), p.23. According to the Article 29 Working Party, "it should be noted that assessing the risk to people's rights and freedoms as a result of a breach has a

⁹⁸ See Article 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIA1 and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017), pp.14-15.

¹⁰⁰ See Article 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIA) and determining whether processing is "likely to result in a high risk" for the purposes of Regulation 2016/679, WP248 rev.01 (4 October 2017), p.15.

¹⁰¹ See Article 29 Working Party, Guidelines on Data Protection Impact Assessment (DPIALE) determining whether processing is "likely to result in a high risk" for the purposes of Repuer 2016/679, WP248 rev.01 (4 October 2017), p.18.

GDPR art.36.3(e).

SECURITY OF PERSONAL DATA (GDPR)

SECURITY AND INCIDENT REPORTING REQUIREMENTS

number of data subjects concerned and the categories and approximate number a personal data records concerned; communicate the name and contact details of the data protection officer or other contact point where more information can be obtained; describe the likely consequences of the personal data breach; and describe the measures taken or proposed to be taken by the controller to address the personal data breach, including, where appropriate, measures to mitigate its possible adverse effects.¹⁰⁹ Where the notification to the supervisory authority is not made within a hours, it shall be accompanied by reasons for the delay. Nevertheless, as full and comprehensive details of the incident may not always be available during this initial period, notification in phases is allowed, 110 providing the controller gives reasone for the delay.¹¹¹ If a processor is used by a controller and the processor becomes aware of a breach of the personal data it is processing on behalf of the controller they must notify the controller "without undue delay".¹¹² However, the contract between the controller and processor could include requirements for early notifical tion by the processor that in turn support the controller's obligations to report to the supervisory authority within 72 hours.¹¹³ It should be noted that the processor dome not need to first assess the likelihood of risk arising from a breach before notific ing the controller: a processor just needs to establish whether a breach has on curred and then notify the controller.114

6-017 **Communication of personal data breaches** When a personal data breach a likely to result in a high risk to the rights and freedoms of natural persons, in addition to notifying the supervisory authority, the controller is also required to communicate the breach to the affected individuals.¹¹⁵ The threshold for communicate ing a breach to individuals is higher than for notifying supervisory authorities and not all notified breaches have to be communicated to individuals, thus protection them from unnecessary notification fatigue. Article 29 Working Party provides a non-exhaustive list of examples of when a breach is likely to result in high risk m individuals and consequently, instances when a controller has to notify a breach to those affected,¹¹⁶ The GDPR states that communication of a breach to individuals should be made "without undue delay",¹¹⁷ which means as soon as possible. The main objective of communications to individuals is to provide timely and specific

112 GDPR art.33,2,

information about steps they should take to protect themselves, such as resetting meswords in the case where their access credentials have been compromised.¹¹⁸

6-018

6-019

Exceptions to communications There are three exemptions to the obligation to communicate data breaches to the individuals.119 The first exemption relates to situations where the controller has applied appropriate technical and organisational measures to protect personal data prior to the breach, in particular those measures that render personal data unintelligible to any person who is not authorised to aceess it. This could, for example, include protecting personal data with state-of-thean encryption, or by tokenisation. The second exemption appears when. immediately following a breach, the controller has taken steps to ensure that the high risk posed to individuals' rights and freedoms is no longer likely to materialise. For example, depending on the circumstances of the case, the controller may have immediately identified and taken action against the individual who has accessed nersonal data before they were able to do anything with it. The last exemption to communicate data breaches to individuals appears when it would involve disproportionate effort to contact individuals, perhaps where their contact details have been lost as a result of the breach or are not known in the first place. For example, the warehouse of a statistical office has flooded and the documents containing personal data were stored only in paper form. Instead, the controller must make a public communication or take a similar measure, whereby the individuals are informed in an equally effective manner. In the case of disproportionate effort, rechnical arrangements could also be envisaged to make information about the breach available on demand, which could prove useful to those individuals who may be affected by a breach, but the controller cannot otherwise contact.¹²⁰

Teoretimate interest to ensure network and information security The processing of personal data to the extent strictly necessary and proportionate for the purposes of ensuring network and information security¹²¹ (NIS) and the security of the related services offered by, or accessible via, those networks and systems, by public authorities, by computer emergency response teams (CERTs), computer security incident response teams (CSIRTs), by providers of electronic communications networks and services and by providers of security technologies and services, constitutes a legitimate interest of the data controller concerned. Consequently, the consent of data subjects is not needed in such cases.¹²² This could, for example, include preventing unauthorised access to electronic communications networks and malicious code distribution and stopping denial of service attacks and damage to computer and electronic communication systems.¹²³ In the same way, the NIS Direcfive explicitly states that personal data is in many cases compromised as a result of MIS incidents. In this context, competent national NIS authorities and data protec-

different focus to the risk considered in a DPIA. The DPIA considers both the risks of the data processing being carried out as planned, and the risks in case of a breach. When considering a potential breach, it looks in general terms at the likelihood of this occurring, and the damage to the data subject that might ensue; in other words, it is an assessment of a hypothetical event. With an actual breach, the event has already occurred, and so the focus is wholly about the resulting risk of the impact of the breach on individuals".

Recital 49 of the General Data Protection Regulation and art.4(2) of the Directive on security of network and information systems use the same definition of "security of network and information systems". See below, para 6-19.

Legal grounds for the personal data processing to be lawful are discussed in para.5-022. GDPR recital 49

tion authorities should cooperate and exchange information on all relevant matters to tackle any personal data breaches resulting from NIS incidents.¹²⁴

C. SECURITY OF NETWORK AND INFORMATION SYSTEMS (NIS DIRECTIVE).

Objectives of the NIS Directive The "NIS Directive" defines a "network and 6-020 information system" as being either an electronic communications network¹²⁵ or an device or group of interconnected or related devices, one or more of which, pursue ant to a program, perform automatic processing of digital data including digital data stored, processed, retrieved or transmitted by these systems for the purposes of the operation, use, protection and maintenance.¹²⁶ The security of these systems consistent in their ability to resist, at a given level of confidence, any action that compromised the availability, authenticity, integrity or confidentiality of stored or transmitted me processed data or the related services offered by, or accessible via, those network and information systems.¹²⁷ In order to fulfil its objectives, the NIS Directives establishes security and notification requirements for two different types of play ers, which are considered as being of particular critical importance: operators of a sential services (OESs) and digital service providers (DSPs). Moreover, at the national level, the NIS Directive lays down obligations for Member States to adom a national strategy as well as to designate national competent authorities, single points of contact and computer security incident response teams (CSIRTs). In an dition, at European level, the NIS Directive creates a Cooperation Group (NIS Cooperation Group) with a view to fostering mutual understanding of challenges related to the implementation of key provisions of the Directive as well as m facilitate strategic cybersecurity cooperation and information sharing among Member States.¹²⁸ In parallel, the Directive creates a CSIRTs network to build confidence between Member States and to boost operational cybersecurity cooperation.129

1. Identification of undertakings subject to security obligations

6-021 Identification of operators of essential services The NIS Directive does not define explicitly which particular entities are considered as OESs under its scope.

SECURITY OF NETWORK AND INFORMATION SYSTEMS (NIS DIRECTIVE)

instead, it provides criteria that Member States are required to apply in order to manufy OESs.¹³⁰ In November 2018 and every two years thereafter, each Member vate is required to submit to the European Commission a list of identified OESs with an establishment on its territory.¹³¹ As a result of this assessment, all entities and fulfil the criteria detailed hereunder shall be identified as OESs and be subject in the security and notification obligations of art. 14^{132} : (i) as a first step, Member states should assess whether an entity of interest belongs to the following sectors and subsectors listed in Annex II of the Directive, which are considered instrumental to ensuring the proper functioning of the internal market: energy electricity, oil and gas), transport (air, rail, water and road), banking (credit institunons), financial market infrastructures (trading venues, central counterparties), health (healthcare providers including hospitals and private clinics), water (drinkme water supply and distribution) and digital infrastructure (internet exchange mints, domain name system service providers, top level domain name registries);¹³³ is a second step, the entity which is subject to the identification needs to provide service which is essential for the maintenance of the critical societal and/or economic activities.¹³⁴ When carrying out this assessment, Member States should take into account that one entity can provide both essential and non-essential rervices. This means that the security and notification requirements of the NIS Directive will apply to a certain operator only to the extent to which it provides essential services;¹³⁵ and (iii) thirdly, it should be clarified whether the provision of me essential service depends on network and information systems.¹³⁶ Hence, as a third step, the identification process requires the assessment of whether an incident, being defined as any event having an actual adverse effect on the security of network and information systems,¹³⁷ would have a significant disruptive effect on the provision of the service. In this context, if appropriate, the assessment should consider sector-specific factors¹³⁸ but also at least the following cross-sectorial fuetors: the number of users relying on the service provided by the entity concerned;

¹²⁴ Directive on security of network and information systems recital 63.

¹²⁵ The concept of "electronic communications network" is defined in art.2(1) of the Directive (EU) 2018/1972 of the European Parliament and of the Council of 11 December 2018 establishing the European Electronic Communications Code (Recast) [2018] OJ L321/36 as being "transmission systems, whether or not based on a permanent infrastructure or centralised administration capacity, and, where applicable, switching or routing equipment and other resources, including network elements which are not active, which permit the conveyance of signals by wire, radio, optical or other electromagnetic means, including satellite networks, fixed (circuit- and packet-switched, including internet) and mobile networks, electricity cable systems, to the extent that they are used for the purpose of transmitting signals, networks used for radio and television broadcasting, and cable television networks, irrespective of the type of information conveyed".

¹²⁶ Directive on security of network and information systems art.4(1).

¹²⁷ Directive on security of network and information systems art.4(2).

¹²⁸ The NIS Cooperation Group, composed of representatives of Member States, the Commission and ENISA, has been established by art.11 of the Directive on security of network and information systems.

¹²⁹ The network of Computer Security Incident Response Teams (the CSIRTs Network), dedicated to sharing information about risks and ongoing threats and cooperating on specific cybersecurity incidents, is established under art.12 of the Directive on security of network and information systems which also defines its roles.

The criteria for identifying OESs are set out in art.5.2 of the Directive on security of network and information systems.

Directive on security of network and information systems arts 5.3 and 5.5.

It should be outlined that when carrying out the identification process, Member States should not add additional criteria because this could narrow the number of identified OESs and jeopardise the minimum harmonisation for OESs enshrined in art.3 of the Directive on security of network and information systems.

For most of the entities which belong to the "traditional sectors", EU legislation contains well developed definitions to which Annex II makes a reference. However, for the sector of digital infrastructure, listed under point 7 of Annex II (Internet Exchange Points, Domain Name Systems and Top-level domain name registries), this is not the case. Therefore, with the aim to clarify these definitions, the Commission provided detailed explanation in the Annex of its Communication of 13 September 2017. See Annex to the Communication from the Commission to the European Parliament and the Council, Making the most of NIS—towards the effective implementation of Directive (EU) 2016/1148 concerning measures for a high common level of security of network and information systems across the Union, COM(2017)476 final/2 (4 October 2017), pp.20–22.

Directive on security of network and information systems art.5.2(a).

^a Directive on security of network and information systems art.14.3.

Directive on security of network and information systems art.5.2(b).

² Directive on security of network and information systems art.4(7).

Directive on security of network and information systems art.6.2. With regard to the sector-specific factors, recital 28 provides some examples which could provide helpful guidance to national authorities: "With regard to energy suppliers, such factors could include the volume or proportion of national power generated; for oil suppliers, the volume per day; for air transport, including airports and air carriers, rail transport and maritime ports, the proportion of national traffic volume and the number of passengers or cargo operations per year; for banking or financial market infrastructures,

the dependency of other sectors referred to in Annex II on the service provided by that entity; the impact that incidents could have, in terms of degree and duration on economic and societal activities or public safety; the market share of that entity the geographic spread with regard to the area that could be affected by an incident and the importance of the entity for maintaining a sufficient level of the service, tak ing into account the availability of alternative means for the provision of that service.¹³⁹

Jurisdiction of Operators of Essential Services ("OESs") For the purposes of 6-022 identifying OESs, establishment on the territory of a Member State implies the an fective and real exercise of activity through stable arrangements, whereas the least form of those arrangements should not be a determining factor.¹⁴⁰ This means the a Member State can have jurisdiction over an OES not only in cases where many operator has its head office on its territory but also in cases where the operator has for example a branch or other type of legal establishment. This has the consequence that several Member States in parallel could have jurisdiction over the same entire Therefore, where an entity provides a service which is essential for the maintenance of critical societal and/or economic activities in more than one Member State than Member States must consult each other before they take a decision on the identification tion of the OES.¹⁴¹ The desired outcome of the consultation is that the involved national authorities exchange arguments and positions and ideally come to the same decision concerning the identification of the operator concerned. However, the Nus Directive does not preclude Member States reaching divergent conclusions whether a particular entity is identified as an OES or not.¹⁴² In the Commission's view Member States should strive to reach a consensus on these issues to avoid a situa tion that the same company is facing different legal status in various Member States Divergence should remain exceptional e.g. when an entity determined as an Ore in one Member State has a marginal and insignificant activity in another one.¹⁴³ in order to facilitate the Member States when taking informed decisions related in whether an operator is essential or not as well as to avoid unnecessary divergence or inconsistencies, the NIS Cooperation Group issued a reference document on modalities of the consultation process in cases with cross-border impact.¹⁴⁴

6-023 Definition of Digital Services Providers (DSPs) The DSPs are the second category of entities included in the scope of the NIS Directive. These entities are

SECURITY OF NETWORK AND INFORMATION SYSTEMS (NIS DIRECTIVE)

insidered to be important economic players due to the fact that they are used by many businesses for the provision of their own services, and a disruption of the initial service could have an impact on the key economic and societal activities.¹⁴⁵ contrary to the OESs, the Directive does not require Member States to identify the DSPs. Therefore, the relevant obligations of the Directive, namely the security and nutifications requirements set out in art. 16 apply to all DSPs within its scope. A digital service" is defined as being any Information Society service¹⁴⁶ which is of avpe listed in Annex III of the NIS Directive. This Annex lists three specific types of services—online market place, online search engine and cloud computing revice: (i) online market place is defined as a service that enables consumers and raders to conclude online sales or service contracts with traders, and it represents me final destination for the conclusion of those contracts.¹⁴⁷ For example, a provider such as eBay can be regarded as an online market place as it allows others to set in shops on its platform in order to make their products and services available mline to consumers or businesses. Also, online application stores for distributions of applications and software are considered as falling under the definition of online market place because they allow app developers to sell or distribute their services meansumers or other businesses. In contrast, intermediaries to third-parties services anch as Skyscanner and price comparison services, which redirect the user to the website of the trader where the actual contract for the service or the product is concluded, are not covered by the definition; (ii) online search engine is defined as a digital service that allows users to carry out searches of, in principle, all websites or websites in a particular language on the basis of a query on any subject. Search functionalities limited to in-site search and price comparison websites are not covered, irrespective of whether the search function is provided by an external search engine;¹⁴⁸ and (iii) finally, cloud computing service is defined as a digital service that enables access to a scalable and elastic pool of shareable computing resources.¹⁴⁹ The term "scalable" refers to computing resources that are flexibly alinented by the cloud service provider, irrespective of the geographical location of the resources, in order to handle fluctuations in demand. The term "elastic pool" is used to describe those computing resources that are provisioned and released according to demand in order to rapidly increase and decrease resources available depending on workload. The term "shareable" is used to describe those computing resources that are provided to multiple users who share a common access to the service, but where the processing is carried out separately for each user, although the service is provided from the same electronic equipment.¹⁵⁰ When meeting these characteristics, the computing resources falling in the scope of the NIS Directive include resources such as networks, servers or other infrastructure, storage, applications and services. In other words, all current main types of cloud service models are targeted, such as Infrastructure as a Service ("IaaS"), Platform as a Service ("PaaS") and Software as a Service ("SaaS").

their systemic importance based on total assets or the ratio of those total assets to GDP; for the health sector, the number of patients under the provider's care per year; for water production, processing and supply, the volume and number and types of users supplied, including, for example, hospital, public service organisations, or individuals, and the existence of alternative sources of water to cover the same geographical area."

Directive on security of network and information systems, recital 48.

⁶ The concept of "Information Society service" is defined as "any service normally provided for remuneration, at a distance, by electronic means and at the individual request of a recipient of services" in art.1(1) of Directive (EU) 2015/1535 of the European Parliament and of the Council of 9 September 2015 laying down a procedure for the provision of information in the field of technical regulations and of rules on Information Society services [2015] OJ L241/1.

Directive on security of network and information systems art.4(17) and recital 15. Directive on security of network and information systems art.4(18) and recital 16. Directive on security of network and information systems art.4(19).

Directive on security of network and information systems recital 17.

Jurisdiction of DSPs As regards the question of territoriality, the Directive take 6-024 into account the cross-border nature of DSPs and does not follow the model multiple parallel jurisdictions but an approach which focuses on where a DSP established in the Union; it will be subject to the jurisdiction of the Member Stan where it has its main establishment, which in principle corresponds to the place where the provider has its head office in the Union.¹⁵¹ In cases where the concrete DSP offers services in the EU but is not established in the EU territory, the NIS Directive imposes on the DSP the obligation to designate a representative in the Union. In that case, the Member State where the representative is established where have jurisdiction over the company.¹⁵² In cases where a DSP provides services in Member State but has not designated a representative in the EU, the Member State can in principle take actions against the DSP as the provider is infringing its obligan tions deriving from the Directive.¹⁵³ This approach allows for a single set of rules to be applied to DSPs with one competent authority responsible for supervision which is particularly important, as many DSPs offer their services across many Member States simultaneously. The application of this approach minimises the compliance burden on DSPs and ensures the proper functioning of the Digital Single Market.

2. Security obligations

Security requirements of OESs For what concerns OESs, Member States are 6-025 required to ensure that, having regard to the state of art, the identified entities take appropriate and proportionate technical and organisational measures to manage the risk posed to the security of network and information systems which the organisa tions use in the provision of their services.¹⁵⁴ In this context, a risk means and reasonably identifiable circumstance or event having a potential adverse effective on the security of network and information systems.¹⁵⁶ Furthermore, Member States must ensure that appropriate measures are taken to prevent and minimise the impact of an incident with a view to ensuring the continuity of those services.¹⁵⁷ In order to provide guidance to the Member States, the NIS Cooperation Group issued nonbinding guidelines concerning the security measures for OESs.¹⁵⁸ As highlighted by the Commission, harmonisation of such requirements would greatly facilitate compliance by OESs which often provide essential services in more than one Member State and the supervision tasks of national competent authorities and CSIRTs.159

6-026

6-027

Notification requirements of OESs Additionally, Member States also have to ansure that OESs notify, without undue delay, the competent authority or the CSIRT egarding any incident that has a significant impact on the continuity of the escential services.¹⁶⁰ Given the already mentioned definition of the term "security of network and information systems", the Cooperation Group considers that any event affecting not only the availability but also the authenticity, integrity or confidentiality of networks and information systems (used in the provision of the essential revice), that has a significant impact on the continuity of the essential service itself should trigger the notification obligation.¹⁶¹ In order to determine the significance of the impact of an incident, the following parameters, in particular, must be taken into account: the number of users affected by the disruption of the essential service. the duration of the incident and the geographical spread with regard to the area affected by the incident.¹⁶² When measuring the significance of incidents, each Member State may also decide industry specific parameters and thresholds, to reflect the reality within a sector or national particularities. A generic threshold can he set at national level (e.g. one million users affected), or different thresholds per industry (e.g. health: 100,000 patients affected, energy: one million users affected). In terms of parameters, Member States can measure significance of the impact by using only the three parameters mentioned above, using an extended generic set of parameters, besides the ones imposed by the Directive, or using sectoral sets of parameters, adapted to particularities within each sector/subsector.163

Possible inclusion of additional sectors Besides the mandatory security and natification requirements of the NIS Directive concerning OESs and taking into account the minimum harmonisation provision enshrined in art.3, Member States can adopt or maintain legislation ensuring a higher level of security of network and information systems. In this regard Member States are in general free to expand the security and notification obligations under art.14 to entities belonging to other sectors and sub-sectors than those listed in Annex II of the NIS Directive. Various Member States have decided to include some of the following additional sectors: public administrations, the postal sector, the food sector, the chemical and nuclear industry, the environmental sector and the civil protection sector.¹⁶⁴

Security requirements of DSPs In the same logic as for OESs, Member States **6-028** are required to ensure that DSPs take appropriate and proportionate technical and organisational measures to manage the risk posed to the security of network and information systems which the companies use in the provision of their services. Those security measures should take into account the state of the art and the fol-

¹⁵³ Directive on security of network and information systems art.18.3.

¹⁵⁴ Directive on security of network and information systems art.14.1.

¹⁵⁵ "Adverse effect" is a concept not defined within the Directive on security of network and information systems. Nonetheless, the NIS Cooperation Group considers the general meaning of the words: preventing success or development, harmful, unfavourable. See NIS Cooperation Group, *Reference document on incident notification for operators of essential services—circumstances of notifica*tion, Publication 02/2018 (February 2018), p.10.

⁵⁴ Annex to the Communication from the Commission to the European Parliament and the Council, Making the most of NIS—towards the effective implementation of Directive (EU) 2016/1148 concerning measures for a high common level of security of network and information systems across the Union, COM(2017)476 final/2 (4 October 2017), pp.23–24.

lowing five elements: security of systems and facilities; incident handling; buse ness continuity management; monitoring, auditing and testing; as well as comple ance with international standards.¹⁶⁵ The Commission adopted an implementing Regulation which further specifies the elements to be taken into account by DSPc when identifying and taking measures to ensure a level of security of network and information systems which they use in the context of offering services referred to in Annex III.¹⁶⁶ Moreover, ENISA issued technical guidelines which define common baseline security objectives as well as different levels of sophistication in their implementation, mapping these against well-known industry standards, national frameworks and certification schemes.¹⁶⁷

Notification requirements of DSPs DSPs have to take the necessary measures 6-029 to prevent and minimise the impact of incidents with a view to ensuring the continue ity of their services.¹⁶⁸ Hence, DSPs are required to notify the competent authority or the CSIRT, without undue delay, of any incident having a substantial impact on the provision of a service.¹⁶⁹ For determination of the impact, the NIS Directive list five particular parameters that need to be taken into account: (i) the number of me ers affected by the incident, in particular users relying on the service for the provi sion of their own services; (ii) the duration of the incident; (iii) the geographicat spread with regard to the area affected by the incident; (iv) the extent of the dismus tion of the functioning of the service; and (v) the extent of the impact on economic and societal activities.¹⁷⁰ In the Implementing Regulation, the Commission further specifies the parameters to be taken into account to determine whether an incident has a substantial impact on the provision of those services.¹⁷¹ As an exemption DSPs which are micro or small enterprises within the meaning of Commission Recommendation 2003/361/EC¹⁷² are excluded from the scope of the security requirements and notification.¹⁷³ This means those businesses that employ fewer than 50 persons and which have an annual turnover and/or an annual balance sheet total not exceeding €10 million, are not bound by such requirements. When determining the size of the entity, it is not of relevance whether the company concerned provides only digital services within the meaning of the NIS Directive or also other services. Moreover, Member States are not allowed to impose any further security and notification requirements on DSPs than those provided in the Directive, except for cases where such measures are necessary to safeguard their essential State functions, in particular to safeguard national security, and to allow

SECURITY OF NETWORK AND INFORMATION SYSTEMS (NIS DIRECTIVE)

for the investigation, detection and prosecution of criminal offences.¹⁷⁴ Finally, it should be highlighted that a DSP is only subject to a light-touch and reactive ex post supervisory control by the national competent authorities.¹⁷⁵ The competent authority concerned should therefore only take action when provided with evidence, for example by the DSP itself, by another competent authority, including a competent authority of another Member State, or by a user of the service, that a DSP is not complying with the security and notification requirements, in particular following the occurrence of an incident.¹⁷⁶

6-030

6-031

National NIS strategy All Member States need to adopt a national strategy on the security of network and information systems ("NIS strategy") defining the antectives and appropriate policy and regulatory measures.177 This strategy should melude strategic objectives, priorities and a governance framework; identification atmeasures on preparedness, response and recovery; cooperation methods between the public and private sectors; awareness raising, training and education; research and development plans related to the NIS strategy, a risk assessment plan as well as a list of actors involved in the strategy implementation. Pursuant to the wording of art 7, the obligation to adopt an NIS strategy only applies to the sectors referred m in Annex II (types of OESs) and to the services referred to in Annex III (types of DSPs). However, art.3 of the NIS Directive specifically sets forth the principle of minimum harmonisation, pursuant to which Member States may adopt or maintain provision with a view to achieving a higher level of security of network of information systems. The application of this principle to the obligation to adopt an NIS strategy enables Member States to include more sectors and services than the aforementioned ones, for example to include public administrations responsible for sensitive sectors and services other than those listed in the Directive's Annexes II and III, which warrant the need of being covered by an NIS strategy, as well as management plans preventing leaks and ensuring adequate protection.

3. Institutions

National competent authorities In order to monitor the application of the Directive at national level and to assess compliance of OESs and DSPs with their obligations, art.8 requires Member States to designate national competent authorities on security of networks and information systems, while explicitly recognising the possibility to designate "one or more national competent authorities".¹⁷⁸ Accordingly, Member States are free to choose to designate one single authority dealing with all sectors and services covered by the Directive or several authorities, depending for example on the type of sector. When deciding on the approach, Member States can

¹⁶⁵ Directive on security of network and information systems art.16.1.

¹⁶⁶ Commission Implementing Regulation (EU) 2018/151 of 30 January 2018 laying down rules for application of Directive (EU) 2016/1148 of the European Parliament and of the Council as regards further specification of the elements to be taken into account by digital service providers for managing the risks posed to the security of network and information systems and of the parameters for determining whether an incident has a substantial impact [2018] OJ L26/48 ("Commission-Implementing Regulation 2018/151") art.2.

⁴⁴ Directive on security of network and information systems art.16.10.

¹⁷⁵ Directive on security of network and information systems art.17.1.

²⁶ Directive on security of network and information systems recital 60.

⁷ Directive on security of network and information systems art.7.

ⁿ Recital 30 of the Directive on security of network and information systems explains this policy choice: "In view of the differences in national governance structures and in order to safeguard already existing sectoral arrangements or Union supervisory and regulatory bodies, and to avoid duplication. Member States should be able to designate more than one national competent authority responsible for fulfilling the tasks link to the security of the network and information systems of operators of essential services and digital service providers under this Directive."

draw on the experience from the national approaches used in the context of the existing legislation on critical infrastructure protection.¹⁷⁹

- Computer Security Incident Response Team(s) ("CSIRT") Additionally 6-032 Member States need to appoint at least one CSIRT¹⁸⁰ entrusted with the task of handling risks and incidents for the types of OESs and DSPs listed in the NIK Directive's Annexes II and III. Member States can opt for establishing a CSIRI within the national competent authority(ies). Taking into account the minimum harmonisation requirement enshrined in art.3 of the Directive, Member States are free to use the CSIRTs also for other sectors not covered by the Directive, such as the public administration. The tasks of designated CSIRTs include monitoring incidents at a national level; providing early warning, alerts, announcements and dissemination of information to relevant stakeholders about risks and incidents responding to incidents; providing dynamic risk and incident analysis and situational awareness; and participating in the network of the national CSIRTs (CSIRTs network) established under art.12.181 Specific additional tasks relate to incident notifications where a Member State decides that CSIRTs, in addition to or instead of national competent authorities, can undertake such roles.¹⁸²
- **6-033** National single point of contact Finally, each Member State must designate a national single point of contact, which will exercise a liaison function to ensure cross-border cooperation with the relevant authorities in other Member States and with the NIS Cooperation Group and the CSIRT network.¹⁸³ This is particularly needed given that Member States may decide to have more than one national authority. Furthermore, Member States need to ensure that the single point of contact is informed about the received notifications from operators of essential services and digital service providers.¹⁸⁴

D. EU CYBERSECURITY AGENCY AND EUROPEAN CERTIFICATION (CYBERSECURITY Act)

6-034 Objectives Whereas ENISA previously had a limited mandate that would have ended in 2020, the first key objective of the Cybersecurity Act is to give the agency a permanent role as the EU agency for cybersecurity. Among its new tasks, ENISA will contribute to increase cybersecurity capabilities at Union level in order to support the actions of Member States in preventing and responding to cyber threats, in particular in the event of cross-border incidents.¹⁸⁵ The Regulation also creates a voluntary European cybersecurity certification framework for ICT products.¹⁸⁶

FU CYBERSECURITY AGENCY AND EUROPEAN CERTIFICATION (CYBERSECURITY ACT)

services¹⁸⁷ and processes.¹⁸⁸ The reason is that many EU Member States have already developed and adopted national cybersecurity certification schemes but these are only recognised at national level, having little or no value outside their countries. Therefore, the Regulation contains rules governing European cybersecurity certification schemes allowing certificates issued under those schemes to be valid and recognised across all Member States.

1. The EU Cybersecurity Agency (ENISA)

6-035

ENISA's structure The administrative and management structure of ENISA is composed of a Management Board, an Executive Board, an Executive Director, an ENISA Advisory Group and a National Liaison Officers Network.¹⁸⁹ The Management Board is composed of one member appointed by each Member State and two members appointed by the Commission. All members are appointed for a renewable term of fours years on the basis of their knowledge in the field of cybersecurity and have the right to vote.¹⁹⁰ The Management Board establishes the general direction of ENISA's operations and is entrusted with the powers necessary to establish the budget, verify the execution of the budget, adopt appropriate financial rules, establish transparent working procedures for decision making, adopt ENISA's work programme, adopt its own rules of procedure, appoint the Executive Director and decide on the extension and termination of the Executive Director's term of office.¹⁹¹ In order to prepare its decisions, the Management Board is assisted by an Executive Board composed of five members appointed from among the members of the Management Board.¹⁹² To ensure regular dialogue with the private sector, consumers' organisations and other relevant stakeholders on issues related to the annual work programme, the ENISA Advisory Group is established by the Management Board. The ENISA Advisory Group is composed of recognised experts representing the relevant stakeholders, such as the ICT industry, providers of electronic communications networks or services available to the public, SMEs, operators of essential services, consumer groups, academic experts in the field of cybersecurity, and representatives of competent authorities in the field of electronic communications, of European standardisation organisations, as well as of law enforcement and data protection supervisory authorities.¹⁹³ Finally, the National Liaison Officers Network is composed of representatives of all Member States (National Liaison Officers) to facilitate the exchange of information between ENISA and the Member States, and to support ENISA in disseminating its activities, findings and recommendations to the relevant stakeholders across the Union.194

ENISA's tasks under the Cybersecurity Act The Cybersecurity Act aims to reinforce ENISA's role as the EU's centre of advice and expertise with regard to

¹⁹¹ Cybersecurity Act art.15.

¹⁸⁴ Directive on security of network and information systems art.10.3.

¹⁸⁵ Cybersecurity Act arts 4.5 and 7.

¹⁸⁶ Cybersecurity Act art.2(12) defines an "ICT" product as "any element or group of elements of network and information systems".

¹⁸⁷ Cybersecurity Act art.2(13) defines an "ICT service" as "any service consisting fully or mainly in the transmission, storing, retrieving or processing of information by means of network and information systems".

¹⁸⁸ Cybersecurity Act art.2(14) defines an "ICT process" as "any set of activities performed to design, develop, deliver or maintain an ICT product or service".

¹⁸⁹ Cybersecurity Act art.13.

¹⁹⁰ Cybersecurity Act art.14.

¹⁹² Cybersecurity Act art.19.

¹⁹³ Cybersecurity Act art.21.

¹⁹⁴ Cybersecurity Act art.23.

cybersecurity matters.¹⁹⁵ A first task assigned to the agency is to contribute to development and implementation of Union policy and law in the field cybersecurity. To that end ENISA will, in particular, issue opinions and guidelin develop best practices and assist Member States and EU institutions, bodies fices and agencies in developing and promoting cybersecurity policies, ¹⁹⁶ A second task of ENISA is to promote capacity-building by assisting Member States preventing, detecting and improving their responsiveness to cyber threats and incidents by providing them with knowledge and expertise as well as by establish ing and implementing vulnerability disclosure policies on a voluntary basis. In the context, ENISA must also support the exchange of information between sectors as providing best practices and guidance on available tools and procedures, as well on how to address regulatory issues related to information-sharing.¹⁹⁷ A third man task of the agency is to analyse emerging technologies, provide topic-specific sessments on the expected impact of technological innovations on cybersecurity and perform long-term strategic analyses of cyber threats and incidents in order identify emerging trends and help prevent incidents. Through a dedicated normal ENISA must make its findings available to the public and compile reports in order to provide guidance to citizens, organisations and businesses across the Union in This task is related to the more general objective of ENISA to raise public aware ness of cybersecurity risks by providing good practices, including in the fields of cyber-hygiene and cyber-literacy,¹⁹⁹ and advice on research needs and priorities and the field of cybersecurity.200 Furthermore, the agency must promote international cooperation on issues related to cybersecurity by working with third countries and international organisations or within relevant international cooperation frameworks.²⁰¹ More fundamentally, the new missions of ENISA also include an increased operational cooperation task at EU level, in particular in the context of large-scale cross-border incidents, as well as a support and promotion task with regard to the development and implementation of the cybersecurity certification framework established by Title III of the Cybersecurity Act.

6-037 Coordinated response to large-scale cybersecurity incidents On 13 September 2017, after the unprecedented WannaCry and NotPetya cyber-attacks, the Commission adopted a Recommendation on coordinated response to large-scale cyberse curity incidents and crises,²⁰² of which the Annex is known as "the Blueprint".²⁰¹ According to the Blueprint, a cybersecurity incident may be considered a crisis at Union level when the disruption caused by the incident is too extensive for a concerned Member State to handle on its own or when it affects two or more Member States with such a wide-ranging impact of technical or political

²⁰¹ Cybersecurity Act art. 12.

RU CYBERSECURITY AGENCY AND EUROPEAN CERTIFICATION (CYBERSECURITY ACT)

senificance that it requires timely coordination and response at Union political Fine order to implement the Blueprint, the NIS Cooperation Group identified maxonomy to categorise causes and impact of large-scale cybersecurity incidents²⁰⁴ anch has been welcomed by the Council.²⁰⁵ The taxonomy has two core parts: the ature of the incident, i.e. the underlying cause that triggered the incident, and the mpact of the incident, i.e. the impact on services, in which sector(s) of economy and society. In such cases, the Blueprint describes how well-established crisis management mechanisms should make full use of existing cybersecurity entities at Effevel as well as of cooperation mechanisms between the Member States. In dome so, the Blueprint takes into account a set of guiding principles (proportionalby subsidiarity, complementarity and confidentiality of information), presents the tore objectives of cooperation (effective response, shared situational awareness, multic communication messages) at three levels (strategic/political, operational and rechnical), the mechanisms and the actors involved as well as the activities to meet and core objectives. The foundation of cooperation amongst Member States in responding to such incidents is provided by the CSIRTs Network established by the MIS Directive and of which the secretariat is provided by ENISA.206

ENISA's operational role increased at EU level The Cybersecurity Act consolidates the agency's operational role in the case of large-scale cross-border incidents by mandating ENISA to gather relevant information and act as a facilitator between the CSIRTs network and the technical community, as well as between decision makers responsible for crisis management. Furthermore, ENISA should support operational cooperation among Member States, where requested by one or more Member States, in the handling of incidents from a technical perspective, by facilitating relevant exchanges of technical solutions between Member States, and by providing input into public communications. ENISA should also support operational cooperation by testing the arrangements for such cooperation through regular cybersecurity exercises.²⁰⁷

6-038

6-039

2. The EU cybersecurity certification framework

EU cybersecurity certification schemes Title III of the Regulation containing the Cybersecurity Act establishes a European cybersecurity certification framework in order to improve the conditions for the functioning of the internal market by enabling a harmonised approach to European cybersecurity certification schemes (hereafter "ECC schemes").²⁰⁸ The aim of this framework is to attest that the ICT processes, products and services that have been evaluated in accordance with ECC schemes is to protect the availability, authenticity, integrity or confidentiality of stored or transmitted or processes and services throughout their life cycle.²⁰⁹ A preliminary task of the Commission is to publish a Union "rolling work

programme"²¹⁰ for European cybersecurity certification that identifies strain priorities for future ECC schemes and include a list of ICT products, services processes or categories thereof that are capable of benefitting from being inclusion in the scope of an ECC scheme.²¹¹ The Union rolling work programme should low industry, national authorities and standardisation bodies, in particular, to pres in advance for future ECC schemes.²¹² When a need is identified on the basis of Union rolling work programme, the Commission may request ENISA to prepare candidate scheme or to review an existing ECC scheme. Moreover, in duly fied cases, the Commission or the European cybersecurity certification ground (ECCG) may request ENISA to prepare a candidate scheme or to review an example. ing ECC scheme which is not included in the Union rolling work programme Union rolling work programme is then updated accordingly.²¹⁴ The candidate new schemes would be prepared by ENISA, after consultation of all relevant stakensta ers²¹⁵ by means of a formal, open, transparent and inclusive consultation process and with the assistance, expert advice and close cooperation of the ECCG 216 p Commission would then be empowered to adopt these ECC schemes by means implementing acts. In principle, from the date established in the implementing act national cybersecurity certification schemes and the related procedures for the reprocesses, products and services covered by a ECC scheme shall cease to produce effects.²¹⁷ Following the same logic, Member States shall not introduce new national cvbersecurity certification schemes for ICT processes, products and service covered by a ECC scheme in force.²¹⁸ However, existing certificates that were h sued under national cybersecurity certification schemes and are covered by an Eco scheme shall remain valid until their expiry date.²¹⁹ Of course, the specified remain ments of the ECC schemes must be consistent with any applicable legal require ments, in particular requirements emanating from harmonised Union law Furthermore, where a specific Union legal act so provides, a certificate or an Au

BU CYBERSECURITY AGENCY AND EUROPEAN CERTIFICATION (CYBERSECURITY ACT)

statement of conformity issued under an ECC scheme may be used to demonstrate the presumption of conformity with requirements of that legal act.²²¹

conjectives of the certification schemes The adopted ECC schemes should be 6-040 designed so as to achieve, as applicable, at least the following security objectives: protect stored, transmitted or otherwise processed data against accidental or authorised storage, processing, access or disclosure and against accidental or manthorised destruction, loss or alteration or lack of availability during the entire the cycle of the ICT product, service or process; that authorised persons, magrammes or machines are able only to access the data, services or functions to their access rights refer; to identify and document known dependencies and aninerabilities; to record which data, services or functions have been accessed, used otherwise processed, at what times and by whom; to make it possible to check which data, services or functions have been accessed, used or otherwise processed, what times and by whom; to verify that ICT products, ICT services and ICT mocesses do not contain known vulnerabilities; to restore the availability and acess to data, services and functions in a timely manner in the event of a physical rechnical incident; that ICT products, ICT services and ICT processes are secure me default and by design and are provided with up-to-date software and hardware that do not contain publicly known vulnerabilities, and are provided with mechanisms for secure updates.222

6-041

Content of the certification schemes The adopted ECC schemes should specify: in a minimum set of elements concerning, amongst others, their subject-matter and scope (including the type or categories of ICT processes, products and services revered); (ii) a clear description of the purpose of the scheme and of how the selected standards and evaluation methods correspond to the needs of the intended avers of the scheme; (iii) references to the international, European or national standards applied in the evaluation or, where such standards are not available or appropriate, to technical specifications that meet the requirements set out in the Regulation on standardisation²²³ or, if such specifications are not available, to rechnical specifications or other cybersecurity requirements defined in the ECC scheme; (iv) specific evaluation criteria and methods used in order to demonstrate that the above-mentioned security objectives are achieved; (v) rules for monitoring compliance with the requirements of the certificates or the EU statement of conformity including mechanisms to demonstrate continued compliance with the mecified cybersecurity requirements; (vi) rules concerning the consequences of non-conformity of certified ICT products, services and processes; (vii) rules concerning how previously undetected cybersecurity vulnerabilities are to be reported and dealt with; (viii) identification of national or international cybersecurity certification schemes covering the same type or categories of ICT products, services or processes; (ix) the content and the format of the European cybersecurity certificates and the EU statements of conformity to be issued including the period

²¹⁰ According to art.47.5 of the Cybersecurity Act, the first Union rolling work programme shall be published 12 months after the entry into force of the Cybersecurity Act. The Union rolling work programme shall be updated at least once every three years and more often if necessary.

²¹¹ Cybersecurity Act art.47. Inclusion of specific ICT products, ICT services and ICT processes are categories thereof in the Union rolling work programme shall be justified on the basis of one or many of the following grounds specified in art.47.3 of the Cybersecurity Act.

²¹² Cybersecurity Act recital 84.

²¹³ The ECCG is established by art.62 of the Cybersecurity Act. The ECCG shall be composed at representatives of national cybersecurity certification authorities or representatives of other relevant national authorities. A member of the ECCG shall not represent more than two Member States Stakeholders and relevant third parties may be invited to attend meetings of the ECCG and to participate in its work.

²¹⁴ Cybersecurity Act art.48.

²¹⁵ A Stakeholder Cybersecurity Certification Group is established by art.22 of the Cybersecurity Act. The Stakeholder Cybersecurity Certification Group shall be composed of members representing industry in balanced proportions, both on the demand side and the supply side of ICT products and ICT services, and including, in particular, SMEs, digital service providers, European and international standardisation bodies, national accreditation bodies, data protection supervisary authorities and conformity assessment bodies, as well as academia and consumer organisations. The Commission, following a transparent and open call, shall select, on the basis of a proposal from ENISA, members of the Stakeholder Cybersecurity Certification Group ensuring a balance between the different stakeholder groups as well as an appropriate gender and geographical balance.

²²⁰ Cybersecurity Act art.54.2.

Cybersecurity Act art.54.3.

Cybersecurity Act art.51.

Regulation (EU) No.1025/2012 of the European Parliament and of the Council of 25 October 2012 on European standardisation, amending Council Directives 89/686/EEC and 93/15/EEC and Directives 94/9/EC, 94/25/EC, 95/16/EC, 97/23/EC, 98/34/EC, 2004/22/EC, 2007/23/EC, 2009/23/EC and 2009/105/EC of the European Parliament and of the Council and repealing Council Decision 87/95/ BEC and Decision No.1673/2006/EC of the European Parliament and of the Council [2012] OJ L316/12.

of the storage of the EU statement of conformity and the technical documentation of all relevant information by the manufacturer or provider; (x) the maximum period of validity of certificates; (xi) the disclosure policy for granted, amended and withdrawn certificates as well as the conditions for the mutual recognition or certification schemes with third countries. Where applicable, the adopted fact schemes should also detail: (i) specific or additional requirements applicable to conformity assessment bodies in order to guarantee their technical competence of evaluate the cybersecurity requirements; (ii) information to be supplied or otherwise be made available to the conformity assessment bodies by an applicant which is necessary for certification; (iii) conditions for granting and renewing a certificate as well as maintaining, continuing, extending or reducing the scope of certification and, finally, rules concerning the retention of records by conformity assessment bodies. Moreover, where the scheme provides for marks or labels, the conditions under which such marks or labels may be used should also be detailed ²⁴

6-042 Assurance levels In addition, depending on the identified level of risk in terms of the probability and impact of an incident as well as on the rigour and depth of the evaluation methodology, an ECC scheme may specify one or more of the following assurance levels: basic, substantial and/or high.²²⁵ These assurance levels refer to a certificate or an EU statement of conformity issued in the context of a ECC scheme, which provides for each assurance level's respective security requirements, including security functionalities and the corresponding degree of effort for the evaluation of an ICT process, product or service. The certificate or the EU statement of conformity is characterised with reference to technical specifications, standards and procedures related thereto, including technical controls, the purpose of which is to decrease the risk of, or to prevent cybersecurity incidents.

6-043 Conformity self-assessment Only for ICT products, services and processes at low risk corresponding to assurance level basic, an ECC scheme may allow for earrying out a conformity assessment under the sole responsibility of the manufacturer or provider.²²⁶ By drawing up an EU statement of conformity stating that the fulfilment of the requirements set out in the scheme has been demonstrated, the manufacturer or provider assumes responsibility for the compliance with the requirements set out in the scheme and must keep all relevant information relating to the conformity at the disposal of the national cybersecurity certification authority for the period provided for in the corresponding ECC scheme.²²⁷ A copy of the EU statement of conformity must be submitted to the national cybersecurity certification authority and to ENISA.²²⁸ EU statements of conformity are recognised in all Member States and are voluntary unless otherwise specified in the Union law or in Member States law.²²⁹

6-044 Cybersecurity certification For assurance level "basic" or "substantial", a European cybersecurity certificate may be issued by conformity assessment bad.

FU CYBERSECURITY AGENCY AND EUROPEAN CERTIFICATION (CYBERSECURITY ACT)

the basis of criteria included in the ECC scheme.²³⁰ Conformity assessment agies meeting the requirements set out in the Annex of the Cybersecurity Act must accredited by the national accreditation body named pursuant to Regulation (EC) 165/2008.²³¹ Where applicable, the conformity assessment bodies shall be authorised by the national cybersecurity certification authority to carry out its tasks then they meet specific or additional requirements set out in the ECC scheme,²³² accreditations are issued for a maximum of five years and may be renewed on the ame conditions, provided that the conformity assessment body meets the arorementioned requirements.²³³ By way of derogation, in duly justified cases, a anticular ECC scheme may provide that a European cybersecurity certificate resultfrom that scheme can only be issued by a public body, which may be a national enersecurity certification authority or a public body that is accredited as a conformav assessment body,²³⁴ In cases where an ECC scheme requires an assurance level meh", the certificate can only be issued by a national cybersecurity certification anthority or by an accredited conformity assessment body upon prior approval by menational cybersecurity certification authority for each individual certificate isund or upon prior general delegation of this task by the national cybersecurity confication authority.235 ICT products, services and processes that have been certined under an ECC scheme shall be presumed to comply with the requirements of uch scheme.²³⁶ A European cybersecurity certificate is recognised in all Member states and is voluntary, unless otherwise specified by Union law or Member State Ing 337 Indeed, the Commission must regularly assess the efficiency and use of the adented ECC schemes and whether a specific scheme is to be made mandatory mough relevant Union law to ensure an adequate level of cybersecurity in the finion and improve the functioning of the internal market.²³⁸ Based on the outcome of those assessments, the Commission shall identify the ICT products, services and processes covered by an existing certification scheme, which are to be covered by a mandatory certification scheme. As a priority, the Commission shall focus on the OFS sectors listed in Annex II of the NIS Directive.²³⁹ The natural or legal person who submits ICT products, services or processes for certification shall make availthe to the national cybersecurity certification authority, where that authority is the andy issuing the European cybersecurity certificate, or to the conformity assessment hody, all information necessary to conduct the certification.²⁴⁰ The holder of a certificate must also inform the authority or body issuing the certificate about any ubsequently detected vulnerabilities or irregularities concerning the security of the certified ICT product, service or process that may have an impact on its compliance with the requirements related to the certification. That authority or body shall

forward that information without undue delay to the national cybersecurity certified tion authority concerned.²⁴¹ Certificates may be issued for the period defined by the particular certification scheme and may be renewed, provided that the relevant requirements continue to be met.²⁴²

- Cybersecurity information to be provided by manufacturers or provid. 6-045 ers European cybersecurity certificates and EU statements of conformity should help end users to make informed choices. Therefore, the manufacturer or provider of certified ICT products, services or processes for which an EU statement of conformity has been issued must make publicly available supplementary cybersecurity information. This information must include guidance and recommendations to assist end users with the secure configuration, installation, deployment, operation and maintenance of the ICT products or ICT services; the period during which security support will be offered to end users, in particular as regards the availability of cybersecurity related updates; contact information of the manufacturer or provider and accepted methods for receiving vulnerability information from end users and security researchers; a reference to online repositories list. ing publicly disclosed vulnerabilities related to the ICT product, service or process and to any relevant cybersecurity advisories.²⁴³ This information must be available in electronic form and be updated as necessary at least until the expiry of the corresponding European cybersecurity certificate or EU statement of conformity 24
- **6-046** Website on European cybersecurity certification schemes ENISA must maintain a dedicated website providing information on, and publicising, ECC schemes, European cybersecurity certificates and EU statements of conformity, including information with regard to European cybersecurity certification schemes which are no longer valid, to withdrawn and expired European cybersecurity certificates and EU statements of conformity, and to the repository of links to cybersecurity information that the manufacturers or providers of certified ICT products, services or processes or for which an EU statement of conformity has been issued must make publicly available. Where applicable, the website shall also indicate the national cybersecurity certification schemes that have been replaced by a ECC scheme.²⁴⁵
- **6-047** National cybersecurity certification authorities Each Member State must designate one or more national cybersecurity certification authorities in its territory or, with the agreement of another Member State, one or more national cybersecurity certification authorities established in that other Member State to be responsible for the supervisory tasks in the designating Member State.²⁴⁶ Each national cybersecurity certification authority must be independent of the entities it supervises in its organisation, funding decisions, legal structure and decision-making.²⁴⁷ Moreover, Member States must ensure that the activities of the national cybersecurity certification authorities that relate to the issuance of European

EU CYBERSECURITY AGENCY AND EUROPEAN CERTIFICATION (CYBERSECURITY ACT)

cybersecurity certificates are strictly separated from their supervisory activities and that those activities are carried out independently from each other.²⁴⁸ Amongst other tasks, national cybersecurity certification authorities must supervise and enforce rules included in ECC schemes for the monitoring of the compliance of ICT products, services and processes with the requirements of the European cybersecurity certificates that have been issued in their respective territories; monitor compliance with and enforce the obligations of the manufacturers or providers that are established in their respective territories; actively assist and support the national accreditation bodies in the monitoring and supervision of the activities of conformity assessment bodies; handle complaints by natural or legal persons, investigate the subject matter of such complaints to the extent appropriate and inform the complainant of the progress and the outcome of the investigation within a reasonable period.²⁴⁹

Right to lodge a complaint and right to a judicial remedy Natural and legal persons have the right to lodge a complaint with the issuer of a European cybersecurity certificate or, where the complaint relates to a European cybersecurity certificate or, where the complaint relates to a European cybersecurity certificate or, where the complaint relates to a European cybersecurity certification authority. The authority or body with which the complaint has been lodged must inform the complainant of the progress of the proceedings, of the decision taken, and of the right to an effective judicial remedy.²⁵⁰ Furthermore, notwithstanding any administrative or other non-judicial remedies, natural and legal persons have the right to an effective judicial remedy with regard to decisions taken by the abovementioned authority or body including, where applicable, in relation to the improper issuing, failure to issue or recognition of a European cybersecurity certificate held by those natural and legal persons as well as with regard to a failure to act on a complaint lodged with the authority or body. Such proceedings must be brought before the courts of the Member State in which the authority or body against which the judicial remedy is sought is located.²⁵¹
