This issue of *RSC Sustainability* publishes the Regional Winners of the first annual Essay Competition, *Young Voices in the Chemical Sciences for Sustainability*, which was organized and managed by the International Organization for Chemical Sciences in Development (IOCD). Through its action groups, including *Chemists for Sustainability*, IOCD works to promote greater attention by the profession of chemistry to sustainability challenges.¹ The competition is sponsored by the Royal Society of Chemistry,² which is a leading voice for the chemical sciences and uses its influence to put sustainability in the spotlight, demonstrating how the chemical sciences can provide solutions to the associated challenges.³

The aims of the competition are to highlight the roles of the chemical sciences in promoting sustainability and to encourage young people to explore the relevance of scientific approaches to tackling sustainability challenges and provide them with an opportunity to present their perspectives. The theme of the 2023 IOCD Essay Competition was “How can the chemical sciences lead the stewardship of the Earth’s element resources?”.

The Essay Competition was open to entrants who were aged under 35 on 31 March 2023. The entries were assessed by

a global team of volunteer evaluators, who selected 21 essays as Finalists based on their relevance and quality. From within this group, essays that were very highly rated were chosen as Regional Winners, with regions being defined according to the World Bank geographic classification.⁴

The six essays designated as 2023 Regional Winners show a wide range of approaches to the theme, as summarized below:

Iris Yu (East Asia and Pacific) (<https://doi.org/10.1039/D3SU90037A>) in Singapore writes about the growing demands for metals and minerals and the critical question of how to sustainably acquire, use and recycle the Earth’s available resources. She builds on the important aspect of resource circulation and presents a model involving a ‘multi-loop resource nexus’ (Fig. 1) to conserve and maximise the utility of available stocks and minimise the fraction lost to waste. This resource nexus provides many specific roles for the chemical sciences and highlights the potential synergies arising from the interactions among different circular economies.

Eleanor Newton (Europe and Central Asia) (<https://doi.org/10.1039/D3SU90042H>) in the UK also begins with the recognition of the growing demand for material resources and the accelerating speed at which useful,

sometimes critical stocks are being depleted. Concluding that the chemical sciences have a stewardship responsibility whose goal must be to manage these resources in a sustainable way, she advances three over-arching approaches. These involve encouraging innovation (especially extending the capacities of upcycling and recycling technologies), promoting education and awareness (as well as for chemists, improving scientific literacy in society and helping educate the public on pressing environmental issues and the importance of chemistry and sustainability in their day-to-day lives), and (“probably most importantly”) advocating for better government regulations.

Mariel Opazo (Latin America and the Caribbean) (<https://doi.org/10.1039/D3SU90038J>) in Chile writes on the energy aspect of climate change, focusing on the over-arching challenge of energy storage in the transition towards renewable energy technologies. Her introduction emphasises the danger of ignoring the interlinkages between different Sustainable Development Goals (SDGs) and highlights the importance of an integral approach through interdisciplinary research. The growing demand for large energy storage facilities and for batteries is driving higher demand for the extraction of Earth’s minerals, especially lithium and rare earth elements, with mining having a wide range of

environmental impacts. She reviews battery and other storage options and considers broader implications arising from mining and its impact, as well as the need for societal engagement in behavioural change and making choices in areas such as transport options and recycling.

Thibaut Martinon (North America) (<https://doi.org/10.1039/D3SU90040A>) in the USA writes on phosphate scarcity and pollution, opening with the quote that “for phosphorus, there is neither substitute nor replacement”. He highlights the ways that profligate use of this unique resource as a fertilizer have led to its widespread dispersal, contaminating surface-level water bodies and creating a multifaceted threat. He stresses the stewardship duty to develop new strategies for mitigating the impending crisis by directing public policy, both at local levels and internationally – for example to remove phosphates from detergents and personal care products. The need for chemical innovation is also emphasised, for example involving alternatives to common synthetic fertilizers in the transition to a sustainable farming economy. The essay also addresses phosphate removal and recovery from surface-level water bodies and highlights the heavy uses of

phosphate-based fertilizers in first-generation biofuels.

Selvakumar Selvarasu (South Asia) (<https://doi.org/10.1039/D3SU90043F>) in India opens with recognition that, as well as chemical sciences and other areas of science and technology (S&T), social and political solutions are needed to address complex environmental challenges such as climate change caused by human behaviour. Scaling up carbon capture to remove atmospheric CO₂, employing both storage and utilization options requires further exploitation. Examples include materials based on metal–organic frameworks that can capture CO₂ more effectively with lower energy requirement. The essay also covers waste and recycling, as well as alternative energy carriers and sources, including green H₂ and biomass. It ends with discussion of the importance of policy and its implementation in society and the need for people to learn from childhood onwards about problems and solutions related to sustainability.

Petra van Der Merwe (Sub-Saharan Africa) (<https://doi.org/10.1039/D3SU90039H>) in South Africa uses a gaming analogy to frame her essay, noting how playing chess parallels the way scientists must approach impacts on the environment. An example traces

the history of our understanding of greenhouse effects and global warming and uses this to introduce the next crisis, in which the efforts to tackle global warming by substitution of energy sources is in turn creating a shortage of critical raw materials. Details of the large and increasing demands for elements required for a single product – the smartphone – illustrate the argument for greater attention to conserving, recovering and cyclically reusing available materials. Her examples include new technologies such as the application of microfluidic processes in the mining sector and of flow processes in synthesis and in the recovery of valuable elements from waste. She concludes that “chemical scientists can only be true leaders in stewarding the sustainability of critical elements if they take ownership of the growing issue” and calls for more interdisciplinary collaboration.

While having different angles of entry and areas of focus, the perspectives of these six Regional Winners share many commonalities. All recognise ways in which the chemical sciences can contribute innovative technical solutions to help conserve and extend the useful lifetime of the Earth’s available element resources while addressing the present and looming environmental crises which

have resulted, in part, from the past lack of attention to waste and to environmental damage caused by massively increasing transformation of planetary resources. They are staunch defenders of research and innovation that could lead to substitutes for scarce elements and polluting substances. All acknowledge that S&T is only part of the solution and that, as well as scientists learning to work together more effectively across disciplines, they must also become more active in engaging with society and policy-makers to ensure that the most sustainable and environment-friendly technologies are adopted.

Essays from the 15 additional Finalists in the 2023 competition are being published on IOCD's website (http://www.iocd.org/v2_index.shtml) and provide further stimulating examples of the perspectives of young people on chemistry's role in stewarding the Earth's material resources. The 2024 IOCD Essay Competition will be launched by IOCD and RSC Sustainability in November 2023.

Stephen Matlin is an organic chemist who served as Professor of Biological Chemistry in City University, London, and Warwick University. He then worked in international development, as Director of the health and education division of the Commonwealth Secretariat, Chief Education Adviser in the UK Department for International Development and Executive Director of the Global Forum for Health Research in Geneva. He is currently a Visiting Professor in the Institute of Global Health Innovation at

Imperial College London. He is a Vice-President of the International Organization for Chemical Sciences in Development (IOCD) and leads IOCD's group the Chemists for Sustainability as well as the Organizing Committee of the IOCD Essay Competition *Young Voices in the Chemical Sciences for Sustainability*.

Federico Rosei holds the Chair of Industrial Chemistry at the University of Trieste since March 2023. Previously he was Professor, Canada Research Chair and UNESCO Chair at Institut National de la Recherche Scientifique near Montreal (Quebec, Canada). He pursues research on structure/property relationships in nanoscale materials, coupled with efforts in capacity building, mentoring and outreach cross disciplinary and geographical boundaries. He is Executive Director of IOCD since 2021, where he leads the group *Materials for Energy Conversion, Saving and Storage (MATECSS)* and is also on the Organizing Committee of the IOCD Essay Competition *Young Voices in the Chemical Sciences for Sustainability*.

Philippe Lambin holds a PhD in physics. He has been professor in the Physics Department of the University of Namur, Belgium, where he is now emeritus professor. Most of his recent research work has been devoted to the electronic properties of carbon nanostructures and 2D materials. Since 2019, he is full professor at the Pedagogical Institute for Higher Education in Bukavu, Democratic Republic of Congo. He was elected member of the Royal Academy of Belgium in 2013. He is Treasurer of IOCD and is also on the Organizing Committee of the IOCD Essay Competition *Young Voices in the Chemical Sciences for Sustainability*.

Lei Jin holds a Ph.D. degree in Energy and Material Science. She served as a FRQNT Postdoctoral Scholar at McGill University, Canada. She was also a joint Postdoctoral Fellow (research team leader) at the Institut National de la Recherche Scientifique, Canada. She is currently a postdoctoral fellow (Outstanding Postdoctoral Program) at the Southern University of Science and Technology, China. She is the Project Manager of the IOCD Essay Competition *Young Voices in the Chemical Sciences for Sustainability*.
